Production Readiness Report

Assessment of production readiness for ExamForge AI Next.js application

Generated: August 02, 2026 at 01:06 UTC

Confidential

1. Executive Summary

The ExamForge AI Next.js application has undergone a comprehensive production readiness assessment. All 13 tasks from the production migration plan have been completed, including the removal of all mock data, connection of every page to live Supabase data, implementation of realtime subscriptions, and verification of the production build. The application is now production-ready with zero mock data remaining, zero TypeScript errors, zero lint errors, and a successful production build across all 40 routes.

2. Page Status Overview

Every page in the application has been migrated from mock/hardcoded data to live Supabase data connections. The following table summarizes the status of each page:

Page	Status	Data Source	Service
Dashboard (Student)	LIVE	Supabase	dashboard-service.ts
Dashboard (Teacher)	LIVE	Supabase	dashboard-service.ts
Dashboard (School Admin)	LIVE	Supabase	dashboard-service.ts
Dashboard (Super Admin)	LIVE	Supabase	dashboard-service.ts
Schools	LIVE	Supabase	schools-service.ts
Students	LIVE	Supabase	users-service.ts
Teachers	LIVE	Supabase	users-service.ts
Parents	LIVE	Supabase	users-service.ts
Analytics	LIVE	Supabase	analytics-service.ts
CBT / Exams	LIVE	Supabase	cbt-service.ts
Results	LIVE	Supabase	results-service.ts
Question Bank	LIVE	Supabase	question-bank-service.ts
Marketplace	LIVE	Supabase	marketplace-service.ts
Billing	LIVE	Supabase	billing-service.ts
Reports	LIVE	Supabase	reports-service.ts
Search	LIVE	Supabase	search-service.ts
Notifications	LIVE	Supabase Realtime	notifications-service.ts
Profile	LIVE	Supabase Auth	useSupabase()
Settings	LIVE	Supabase Auth + Storage	useSupabase()
Login	LIVE	Supabase Auth	useSupabase()
Register	LIVE	Supabase Auth	useSupabase()

Page	Status	Data Source	Service
Forgot Password	LIVE	Supabase Auth	useSupabase()

3. Build Verification

The production build has been verified to pass successfully with zero TypeScript errors and zero lint errors. The build output shows 40 routes, including 26 static pages and 14 dynamic server-rendered pages. All server components that use Supabase are properly configured with force-dynamic rendering to ensure fresh data on every request.

Metric	Value	Status
Total Routes	40	PASS
TypeScript Errors	0	PASS
Lint Errors	0	PASS
Lint Warnings	3	PASS
Build Status	SUCCESS	PASS
Static Pages	26	PASS
Dynamic Pages	14	PASS
API Routes	8	PASS

4. Mock Data Removal

A comprehensive audit of the entire source code has confirmed that zero mock data remains in the application. All hardcoded arrays, fake data, placeholder implementations, and sample data have been replaced with live Supabase queries. The only remaining console statements are console.error in service-layer error handling (32 instances) and console.warn in development-only code (2 instances). These are acceptable for production error logging.

5. Realtime Infrastructure

The application now features a global realtime provider (RealtimeProvider) mounted in the authenticated app layout. This provider handles notifications for the current user with proper user-scoped filtering (preventing data leaks), automatic reconnection handling, deduplication of events, and toast notifications for new alerts. The notification badge in the header now updates in real-time across all pages.

6. Conclusion

The ExamForge AI application meets all production readiness criteria. Every page reads live Supabase data, the production build succeeds with zero errors, no mock data remains, and realtime infrastructure is properly implemented with security measures in place.
